## Mechanical Load Cycles Effect on Bond Strength of One-step Adhesives

Friday, March 18, 2011: 2 p.m. - 3:15 p.m.
Location: Hall D (San Diego Convention Center)
Presentation Type: Poster Session
M. YAMAUTI, I. CABELLO, F.S. AGUILERA, R. OSORIO, and M. TOLEDANO, School of Dentistry, University of Granada, Granada, Spain

Pre-clinical in vitro investigations are desirable to estimate fatigue resistance and failure predictability of new dental adhesives. Objectives: To evaluate the influence of different fatigue load cycling on the bond strength of one-step self-etch adhesives to human dentin.

Methods: Three one-step self-etch adhesives: Tokuyama Bond Force (TBF, Tokuyama Dental Corporation), One-Up Bond F plus (OUB, Tokuyama Dental Corporation), and G-Bond (GB, GC Corporation) were used. Flat, mid-coronal dentin surfaces were bonded with the adhesives according to manufacturers' instructions. Bonded teeth were stored in water at $37^{\circ} \mathrm{C}$ for 24 h and were divided into three groups: 1) sectioned into beams with $1.0 \mathrm{~mm}^{2}$ cross-sectional area, 2) fatigue load cycled ( 5000 cycles, $90 \mathrm{~N}, 3.0 \mathrm{~Hz}$ ) and sectioned into beams, 3 ) fatigue load cycled ( 50000 cycles, $90 \mathrm{~N}, 3.0 \mathrm{~Hz}$ ) and sectioned into beams. Beams were tested in tension until fracture at $0.5 \mathrm{~mm} / \mathrm{min}$. Load cycles were applied in wet conditions. ANOVA and SNK multiple comparisons tests were performed at $\mathrm{P}<0.05$.

Results: Mean (SD) bond strength values (MPa) are shown in the table. Same numbers indicate no differences in columns and letters in rows.

|  | 24 h | 5000 cycles |  | 50000 cycles |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| TBF | $31.76(10.91)$ | 1 a | $16.45(9.06)$ | 2 b | $34.37(9.37)$ |
| 1a |  |  |  |  |  |
| OUB | $28.23(10.30)$ | 1 a | $28.76(9.08)$ | 1 a | $31.45(10.03)$ |
| 1 a |  |  |  |  |  |
| GB | $14.30(4.75)$ | 2 a | $13.16(4.04)$ | 2 a | $15.44 \quad(8.79)$ |
|  | 2 a |  |  |  |  |

Conclusions: TBF and OUB attained the highest bond strength. Fatigue resistance at 50000 cycles was attained for the three tested adhesives. (CICYT/FEDER MAT2008-02347/MAT, JA-P08-CTS-3944, P07-CTS-2568 and Tokuyama Dental Corp.).
